Index of Literature Reviews and Summaries in the *Psychological Bulletin*, 1967–1978

Ludy T. Benjamin, Jr., and Leigh S. Shaffer
Nebraska Wesleyan University

This index updates a previous compilation by Thomas Andrews and Frances Kerr, which was published in 1967 in the *Psychological Bulletin* (*68*, 178–212), covering the years 1940–1966. The *Psychological Bulletin* has continued to be the major source of literature reviews and summaries on topics of interest to psychologists, and the present index was designed to facilitate access to that material. Like the earlier index, the current one includes all articles that were wholly or largely reviews of a specialized area of literature. Published comments on those review articles have also been included. Those articles that were judged not to qualify as literature reviews were excluded from this index. The author index is completely cross-referenced. Articles are designated by author, volume number, and page number(s). In the subject index, the number of items in the reference section of each article is also provided. The letter *P* following a subject listing indicates that the particular subject is only part of the review article. In preparing the subject index the articles were cross-referenced on a large number of headings in an attempt to make topical retrieval by the researcher as fruitful as possible.

Index of Reviews and Notes on Statistical Methods and Research Design in the *Psychological Bulletin*, 1967–1978

Leigh S. Shaffer and Ludy T. Benjamin, Jr.
Nebraska Wesleyan University

This index updates the previous index of reviews and notes on statistical methods and research design compiled in 1967 by Thomas Andrews and published by the *Psychological Bulletin* (*68*, 213–220). This index complements the index of literature reviews and summaries by including useful treatments of statistical procedures and research design considerations that did not qualify as literature reviews. Organization of this index is identical to that of the index of literature reviews and summaries and articles on topics of statistics and research design that are included in the larger index are also included in this index.
